#7784-12 High Temperature Glue Sticks

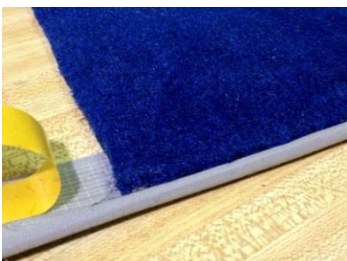

Bond's 7784 is a tough flexible polyamide based adhesive that exhibits excellent adhesion to many difficult to bond substrates. Suitable for product assembly, outdoor binding, woodworking and packaging applications that require both high and low heat resistance.

Please note: 7784 is a polyamide based product and will consequently absorb small amounts of moisture from the atmosphere. This does not affect the performance of the adhesive; however, even a small amount of moisture contamination will turn into a large amount of steam at glue gun temperature. This will cause the glue gun to drip, foam and the glue stick to back up. Please keep the adhesive sealed in the special packs provided. Moisture contaminated adhesive may be dried in an oven at 158°F for 24-48 hours.

Outdoor Marine Instabind

It is necessary to use our #7784 temperature resistant glue sticks with our Outdoor Marine Instabind products along with any glue applications that you will be doing outside. This is the only way that the products will hold and last as they are advertised to do.
